STATIONS WITH HIGHEST MORBIDITY RATES	71

WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. Troops in transit and certain small detachments are not required to submit reports; for this and other reasons, total strength of reporting units has been consistently about 1 percent below the actual strength of the Army in this country. The mean strength shown for individual stations is that of Army personnel attached or assigned for medical care and does not include organizations not on the post but dependent on the station for hospitalization.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

Admissions are reported only for cases hospitalized or confined to quarters and excused from duty for 24 hours or longer, except for certain cases carded for record only (chiefly venereal disease cases treated on a duty status, and deaths which occurred before admission to hospital or quarters). Admissions designated as "injury" comprise all traumatisms other than battle casualties (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, and reactions to medications as well as various types of wounds not due to enemy action). Under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties. All cases other than those of injury or battle casualty are classified as "disease."

Admission rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The average proportion of the daily strength of the command which is confined to hospital or quarters (mean number of non-effectives per thousand strength) is given in the summary table for the total United States and for each of the Service Commands. This ratio may not be significant when the strength of a Command is changing markedly or when a Command has a relatively large number of General Hospitals.

The number of enlisted men discharged during the week on Certificates of Disability for Discharge (CDD) are shown for individual stations. These data should be distinguished from the figures for "honorable discharges for physical and mental disqualification" assembled by The Adjutant General's Office; the latter include discharges for inaptiness in addition to CDD's and are tabulated on a somewhat different basis (e.g., the April data represent April discharges processed by the AGO during April and May plus discharges prior to April which were processed in May).

MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 15 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of total beds authorized and total beds occupied.

Unless otherwise specified, beds authorized as shown in this report are defined in par. 36h of AR 40-1080, C 2. Total beds include expansion beds in addition to normal beds. Beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in the tabulations for individual stations.

Regional Hospitals are distinguished from Station Hospitals by the letters (RH) appearing after the name of the station. Likewise Convalescent Hospitals are denoted by the letters (CH).

In the case of General Hospitals there are shown, in addition, the number of Army patients admitted, the number disposed of during the week (by return to duty, transfer, death, CDD, or otherwise), and the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, subdivided by disease, injury, and battle casualty patients. The patient days of treatment are presented separately for hospital and for convalescent facilities. The bed capacity and beds occupied in convalescent facilities are also indicated.

EXPLANATORY MATTER

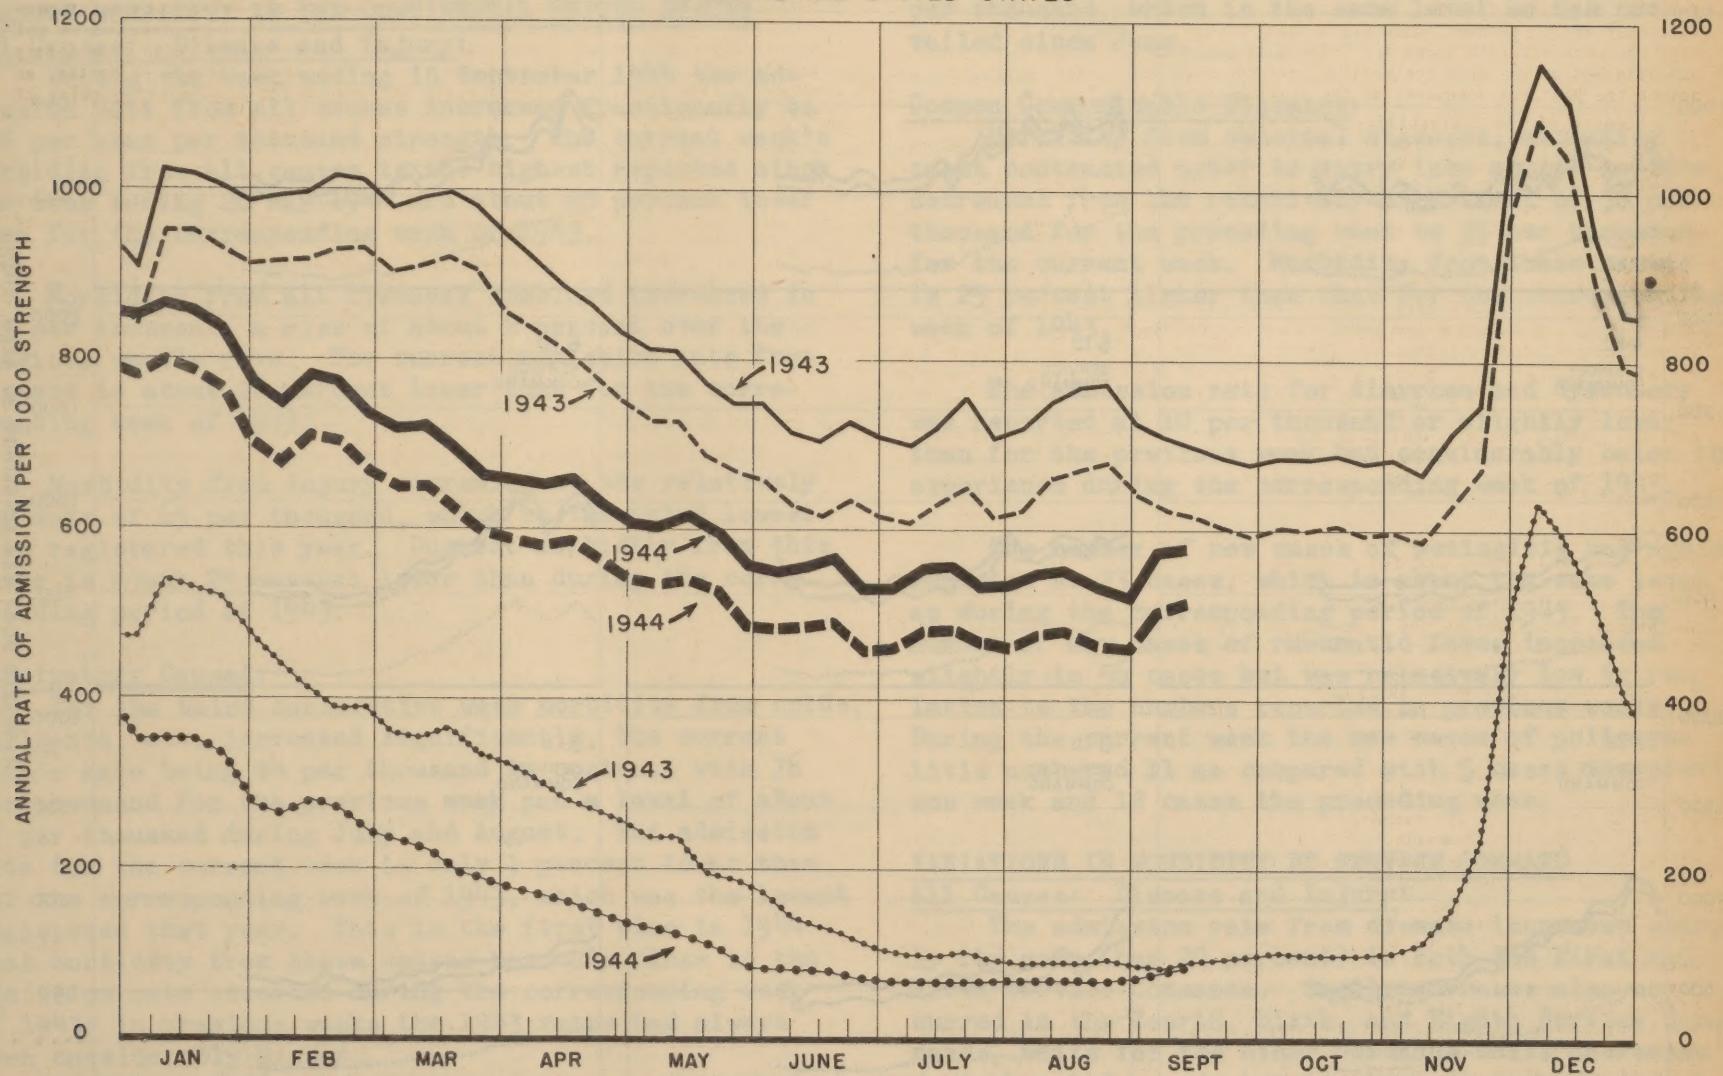

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station have not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

WEEKLY HEALTH REPORT

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

All Causes: Disease and Injury:

During the week ending 15 September 1944 the admission rate from all causes increased fractionally to 578 per year per thousand strength. The current week's morbidity from all causes is the highest reported since the week ending 26 May 1944 and about 20 percent lower than for the corresponding week of 1943.

Morbidity from all diseases combined increased to 513 per thousand, a rise of about 2 percent over the previous week's rate. The current admission rate from disease is about 20 percent lower than for the corresponding week of 1943.

Morbidity from injury decreased to the relatively low rate of 65 per thousand, which is the third lowest rate registered this year. Current morbidity from this cause is about 25 percent lower than during the corresponding period of 1943.

Respiratory Causes:

For the third consecutive week morbidity from colds, influenza, etc. increased significantly, the current week's rate being 84 per thousand in contrast with 76 per thousand for the previous week and a level of about 67 per thousand during July and August. The admission rate for the current week is only 1 percent lower than for the corresponding week of 1943, which was the lowest registered that year. This is the first time in 1944 that morbidity from these causes has come close to the admission rate recorded during the corresponding week of 1943; in previous weeks the 1943 rates had always been considerably higher.

The admission rate from pneumonia remained at 6

per thousand, which is the same level as has prevailed since June.

Common Communicable Diseases:

Morbidity from venereal diseases, excluding cases contracted prior to entry into active service, decreased from the relatively high level of 38 per thousand for the preceding week to 35 per thousand for the current week. Morbidity from these causes is 25 percent higher than that for the corresponding week of 1943.

The admission rate for diarrhea and dysentery was reported at 10 per thousand or slightly lower than for the previous week but considerably below the experience during the corresponding week of 1943.

The number of new cases of meningitis was again reported at 23 cases, which is about the same level as during the corresponding period of 1943. The number of new cases of rheumatic fever increased slightly to 56 cases but was relatively low in relation to the numbers reported in previous weeks. During the current week the new cases of poliomyelitis numbered 11 as compared with 5 cases the previous week and 12 cases the preceding week.

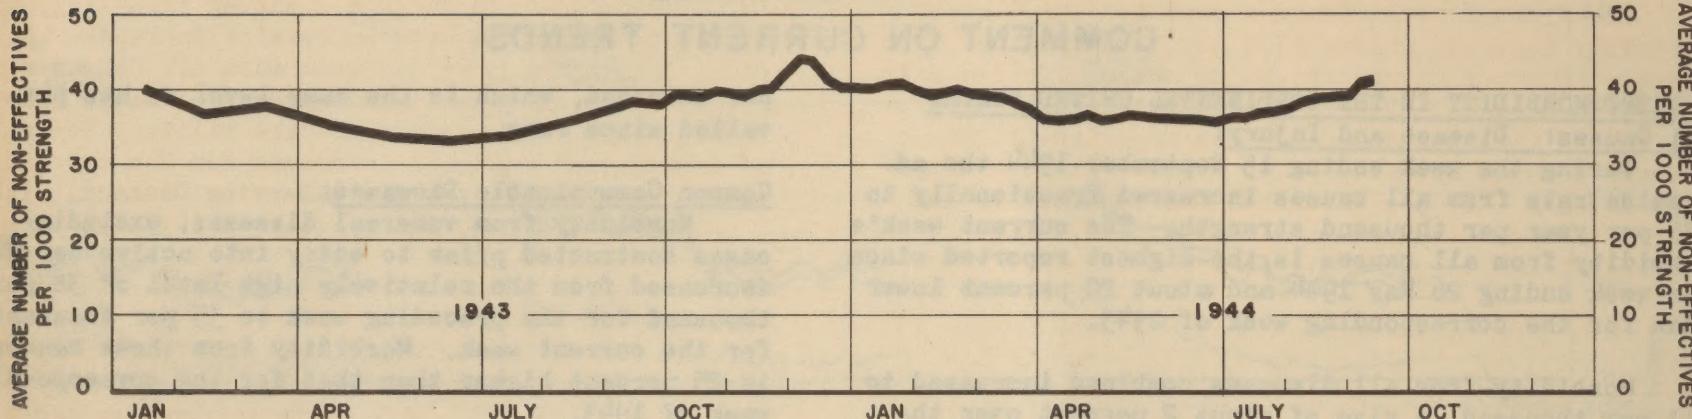

VARIATIONS IN MORBIDITY BY SERVICE COMMAND

All Causes: Disease and Injury:

The admission rate from disease increased sharply (by more than 20 percent) in both the First and Fifth Service Commands. Small increases also occurred in the Fourth, Sixth, and Eighth Service Commands, while for the other Commands small decreases were reported.

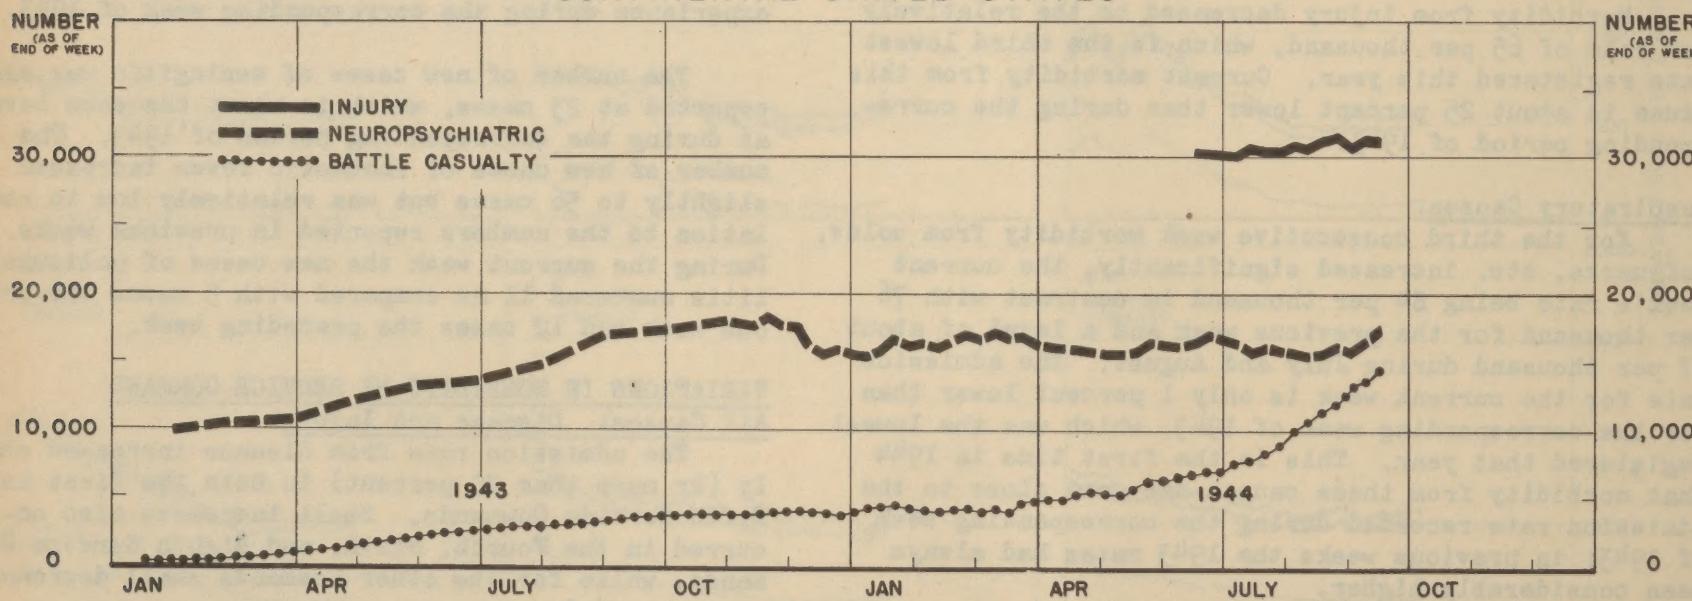

NON-EFFECTIVE RATE

CONTINENTAL UNITED STATES

PATIENTS REMAINING UNDER TREATMENT

CONTINENTAL UNITED STATES

COMMENT ON CURRENT TRENDS (CONT'D)

The Fifth Service Command reported the highest morbidity from all causes (709 per thousand) and from disease (631 per thousand), being closely followed by the First Service Command. The lowest morbidity from all causes (521 per thousand) was reported by the Seventh Service Command, while the lowest morbidity from disease (461 per thousand) was reported by the Eighth Service Command, which for the last 7 weeks has registered the lowest admission rates from disease.

Most Service Commands reported low admission rates from injury; only in the Third, Fifth, and Eighth Service Commands were there increases, and these were relatively small. The largest decreases were reported in the Fourth and Seventh Service Commands and the Military District of Washington. The Fifth Service Command, with a rate of 78 per thousand, reported the highest admission rate from injury, while the First and Sixth Service Commands, with rates of about 45 per thousand, and the Military District of Washington (37 per thousand) were the lowest.

Respiratory Causes:

The admission rate from colds, influenza, etc. increased in all Service Commands except the Ninth, where a fractional decrease was reported. The sharpest increases were registered in the First, Third, Fifth, Sixth, and Eighth Service Commands and the Military District of Washington.

The Second Service Command continued to report the highest morbidity from colds, influenza, etc. (134 per thousand). Two other Service Commands, the First and the Sixth, reported admission rates in excess of 100 per thousand from these causes. Only the Fourth Service Command reported a rate of less than 70 per thousand, whereas several weeks ago most of the Commands were in this category.

Morbidity from pneumonia showed relatively little variation as between Service Commands. However, unlike the previous week when all Commands reported about the same rate, several Commands (the Third, Sixth, and Seventh and the Military District of Washington) reported increases for the current week. As a result the Sixth Service Command, with a rate of 13 per thousand, reported the highest morbidity from this cause.

Common Communicable Diseases:

Morbidity due to "new" venereal (excluding KPTS) cases decreased in every Service Command except the Third and Sixth. The greatest decreases were registered in the First and Seventh Service Commands. The Sixth Service Command, with a rate of 59 per thousand, reported by far the highest morbidity from these causes. The lowest morbidity (13 per thousand) was reported by the Military District of Washington, while the next lowest was the Ninth Service Command (29 per thousand).

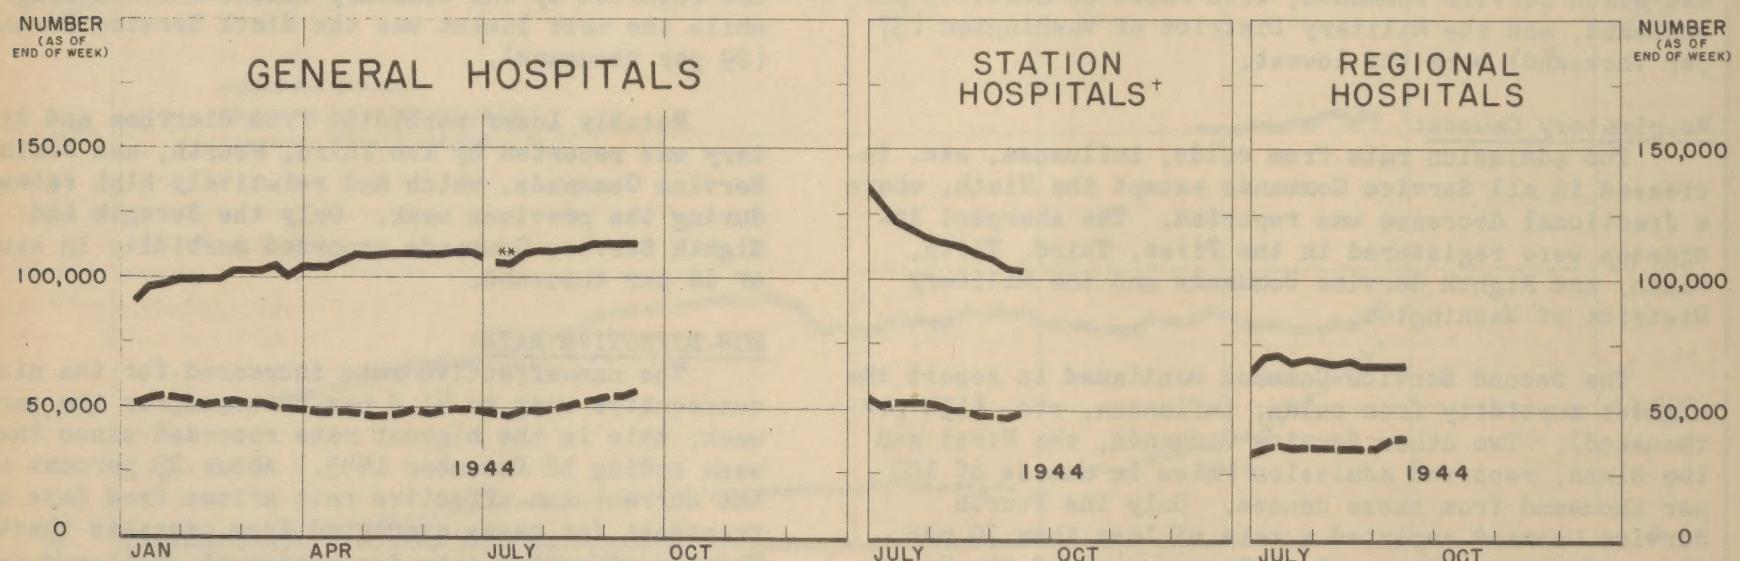

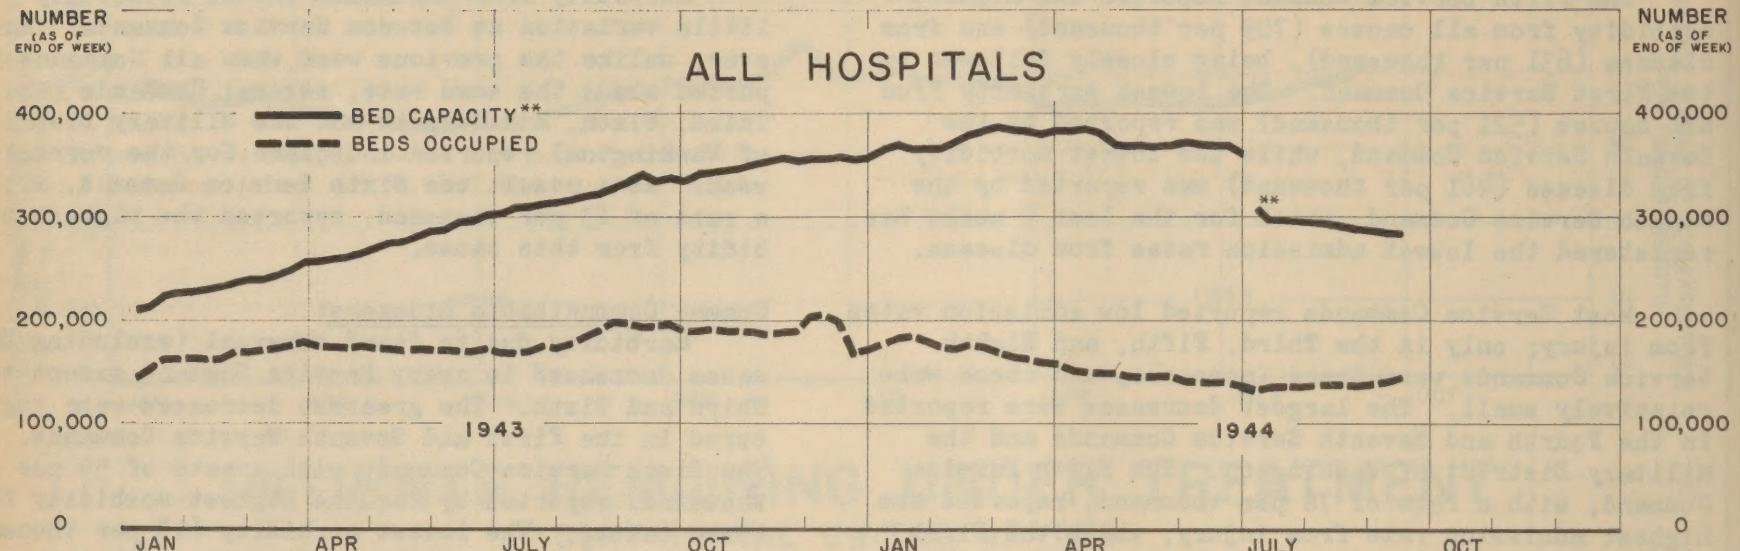

Notably lower morbidity from diarrhea and dysentery was reported by the Third, Fourth, and Ninth Service Commands, which had relatively high rates during the previous week. Only the Seventh and Eighth Service Commands reported morbidity in excess of 10 per thousand.

NON-EFFECTIVE RATE:

The non-effective rate increased for the ninth consecutive week to 41.2 per thousand for the current week; this is the highest rate recorded since the week ending 18 December 1943. About 25 percent of the current non-effective rate arises from days of treatment for cases evacuated from overseas theaters. The non-effective rate for personnel stationed in this country is estimated to be lower than in 1943.

HOSPITALIZATION DATA*

CONTINENTAL UNITED STATES

*EXCLUSIVE OF BEDS REPORTED IN DISPENSARIES, CONVALESCENT FACILITIES, VENEREAL DISEASE FACILITIES, AND COLLEGE TRAINING UNITS.

**AFTER JUNE 1944 DATA ARE FOR AUTHORIZED BEDS

⁺ ALSO INCLUDES BEDS IN NON-FIXED HOSPITALS AT MANEUVER AREAS.

MEDICAL STATISTICS DIVISION, HEALTH REPORTS BRANCH

COMMENT ON CURRENT TRENDS (CONT'D)

PATIENTS REMAINING UNDER TREATMENT:

The total number of Army patients remaining in hospital at the end of the week represented a rate of 41.6 per thousand strength. The number of neuropsychiatric cases remaining as of 15 September 1944 was reported at 17,435 or about 1,000 more than the previous week; out of the 17,435 cases 8,534 were in General Hospitals. The number of neuropsychiatric cases remaining was at the highest point since 4 December 1943.

The number of non-battle injury patients remaining under treatment in hospital and quarters as of 15 September 1944 totaled about 31,000. The number of battle casualty patients remaining increased by about 1,100 to 14,748; all but 179 of these were in General Hospitals.

CERTIFICATES OF DISABILITY FOR DISCHARGE:

During the week ending 15 September 1944 the total number of enlisted men discharged by CDD was 4,091-about 270 more than the previous week and the highest number recorded since such data have been reported (in July and subsequent). About 49 percent of these discharges were reported by General Hospitals.

CURRENT HOSPITAL CONDITIONS:

The total authorized beds as of 15 September 1944 numbered about 282,500 or 1,000 less than at the end of the previous week. The total number of beds occupied was 143,500 (or 51 percent of the total beds authorized) which was about 3,500 more than at the end of the previous week.

The total authorized beds in General Hospitals numbered 113,306. The total number of beds occupied in General Hospitals was 55,919 (or 49 percent of the authorized beds) which was about 1,000 more than at the end of the previous week and the highest number ever reported.

Station hospitals (as distinct from Regional Hospitals) reported about 103,000 total authorized beds, while Regional Hospitals reported about 67,000 beds. The number of beds occupied at station hospitals was about 49,000 or 48 percent of total authorized beds. The beds occupied at Regional Hospitals numbered about 39,000 or 58 percent of total authorized beds. Nine stations (Stockton Ordnance Depot, Calif., Fort Wayne, Mich., Fort Baker, Calif., Camp Clark, Mo., Lemoore AAF, Calif., Camp Gruber, Okla., Hamilton Field, Calif., Florence, Ariz., and Mitchel Field, N.Y.) reported more beds occupied than authorized beds; the first three of these were in this same category last week.

Included among the station hospitals are eleven which are designated as Convalescent Hospitals (ZI). These hospitals reported 5,708 authorized hospital beds (3,399 occupied) and in addition 13,303 beds in convalescent facilities (2,638 occupied).

The bed capacity of convalescent facilities in General Hospitals was 21,776. The total beds occupied in such convalescent facilities was 7,212 or 33 percent of the total bed capacity.

On page 27 there are presented summary data for beds occupied in all General Hospitals combined as of 15 September 1944.

SUPPLEMENTARY HEALTH REPORT

FOR THE FOUR WEEK PERIOD ENDING 25 AUGUST 1944

COMMENT ON RECENT DEVELOPMENTS

NATURE OF THE DATA:

The data of this Supplementary Report, like those of the Weekly Health Reports, have been taken from Forms 86ab rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. However, unlike the Weekly Health Reports which are compiled on the basis of the figures as received, so as to place the information in circulation at the earliest possible time, the figures here presented for the four week period ending 25 August 1944 include the great majority of the corrected reports as well as reports received too late to be incorporated in the Weekly Health Report.

This Supplementary Report covers morbidity and mortality data for all individual stations with a strength of 1000 or over and gives details for admissions from venereal diseases and for neuropsychiatric cases.

Charts showing morbidity trends from all causes, from all diseases combined, from injury, and from colds, influenza, etc. are presented on page 35. Similar charts for specified diseases appear on pages 37, 39, and 41. A chart showing mortality trends is presented on page 43. A summary for the month of the number of admissions and corresponding morbidity rates and of the number of deaths and corresponding mortality rates for the United States as a whole and for the Service Commands is given on page 44. The most pertinent morbidity data for individual stations are presented on pages 45 to 70. On pages 71 and 72 the six stations with the highest rates of admission during the month are shown for each of the morbidity cate-

gories considered.

In reading the detailed tables, it should be borne in mind that morbidity (or mortality) rates based on small numbers of cases are not reliable. For this reason the symbol "?" has been placed after rates computed on the basis of 5 or fewer cases. Attention is directed to the definitions of admissions and admission rates and the discussion of the proportion of total Army strength included in the stations covered by this Report as given on page 2. The term "month" in this report is used to denote the four or five week period based on the number of Fridays in the calendar month.

MORBIDITY FROM ALL CAUSES: DISEASE AND INJURY

Morbidity from all causes and from disease was slightly lower in August than in July, the decreases registered in the admission rates being only fractional. Since the last peak rate recorded in December 1943, the admission rate from disease has declined more than 50 percent, almost entirely because of lower morbidity from colds, influenza, etc. The August admission rate for all causes (543 per year per thousand strength) was at the lowest point for this war and almost 30 percent below the rate for August 1943.

The admission rate from injury remained at 72 per thousand or about the same level as for the year to date and the same as for the previous two months. Current morbidity from this cause is more than 20 percent under that for the corresponding month of 1943.

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

Despite the slight decrease in morbidity from disease for the United States as a whole, increases in the neighborhood of 5 percent were reported by a number of the Service Commands, but these were offset by moderate decreases in the three largest Service Commands, the Fourth, Eighth, and Ninth. The Second Service Command reported in July the highest admission rates from all causes and from disease (both about 10 percent higher than for the country as a whole). The lowest admission rates from all causes and from disease were registered in the Eighth Service Command (both about 7 percent under those for the United States as a whole). The Fourth, Fifth, Sixth, and Ninth Service Commands all experienced morbidity from disease within 2 percent of the rate for the total United States.

The highest morbidity from injury was reported by the Eighth Service Command (52 per thousand), while the lowest rates were recorded in the Military District of Washington and the First and Sixth Service Commands, all of which had rates of about 60 per thousand.

RESPIRATORY DISEASES:

The admission rate from colds, influenza, etc. for August was 67 per thousand or fractionally higher than for July. This is the first month this year which did not show an appreciable decline in morbidity from these causes. Nevertheless, the rate for August was 30 percent lower than for August 1943 and 88 percent under the peak rate of December 1943. Moreover, current morbidity from these causes is by far at the lowest level recorded during this war.

Morbidity from colds, influenza, etc. in the different Service Commands did not show any pronounced changes in August as compared with July except that in the Second Service Command and the Military District of Washington relatively sharp increases occurred in August. The Second Service Command reported the highest morbidity

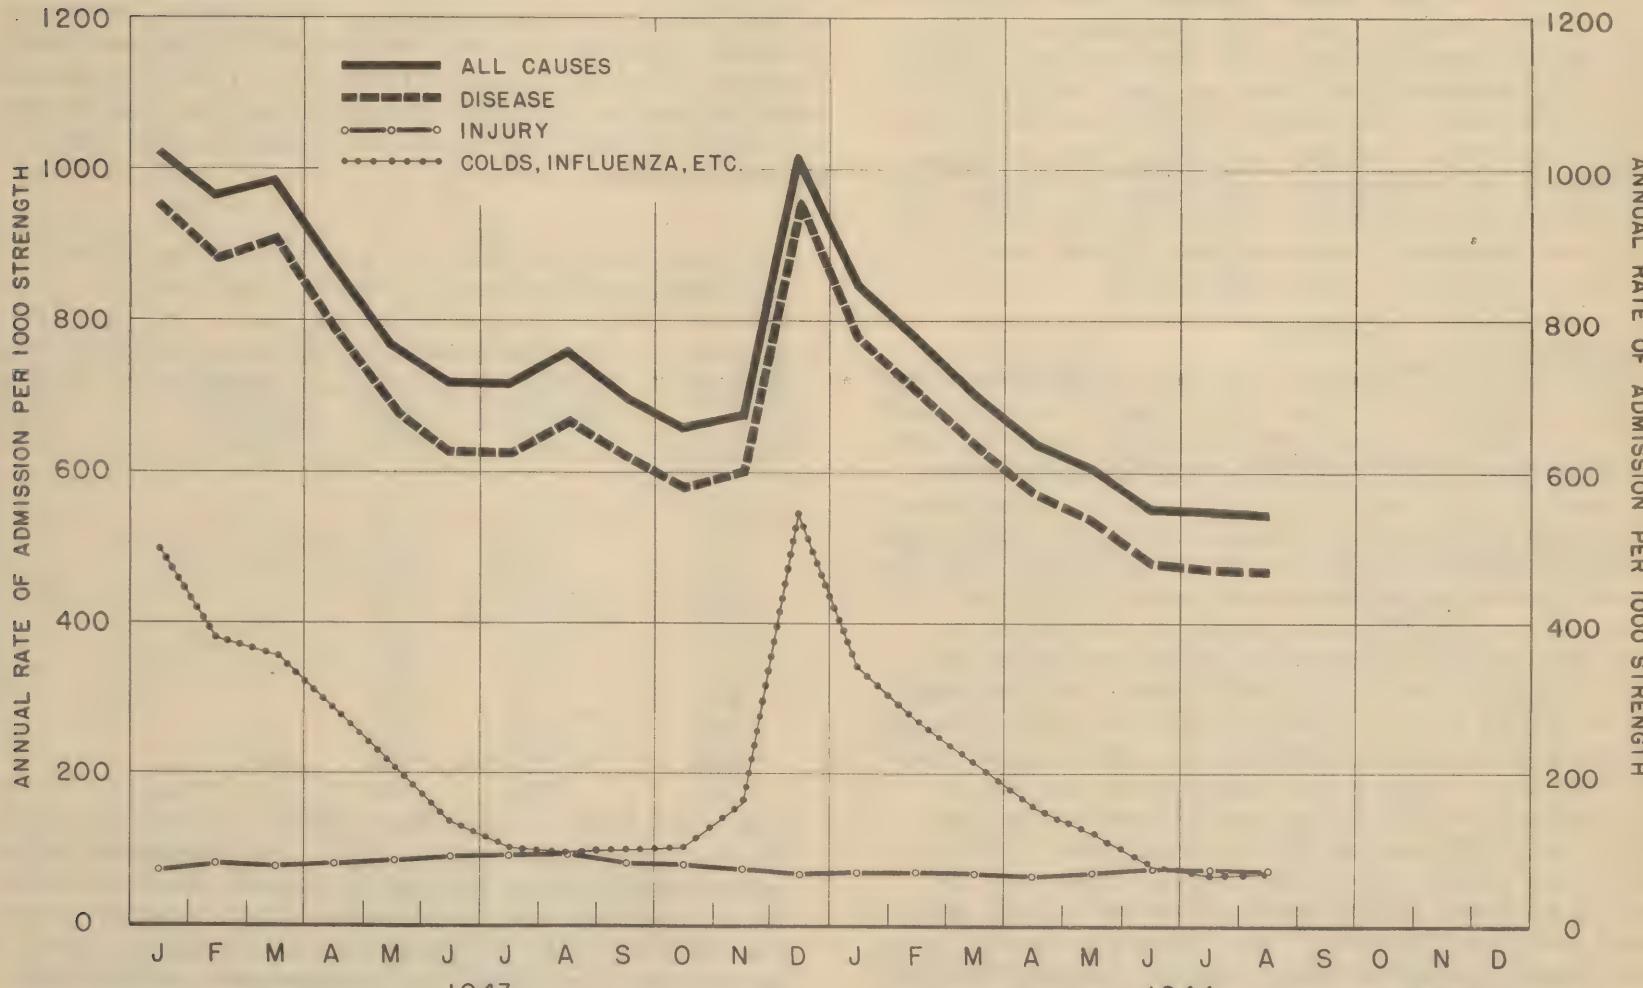

from these causes (97 per thousand) and was the only one to have a rate in excess of 75 per thousand. The lowest morbidity rates were reported by the Fifth and Seventh Service Commands (at about 60 per thousand).

Morbidity from all forms of pneumonia decreased somewhat in August for the seventh consecutive month. The admission rate of 5.7 per thousand for August was about 75 percent lower than the peak rate registered in January 1944 and was about 35 percent lower than the rate for August 1943. Current morbidity from this cause is now at the lowest level registered during this war, the previous low having been reported in July 1942. The Sixth Service Command continued to experience by far the highest morbidity from this cause; even though the August admission rate from pneumonia in this Service Command was about 15 percent lower than the July rate, it was more than 60 percent above the August rate for the country as a whole.

In August atypical pneumonia accounted for more than 75 percent of the total admissions from pneumonia, the highest proportion thus far recorded. The percentage of pneumonia cases diagnosed as atypical was highest in the Military District of Washington and the Fourth, Sixth, and Eighth Service Commands, in all of which the proportion was at least 80 percent.

MORBIDITY FROM — ALL CAUSES — DISEASE — INJURY — COLDS, INFLUENZA, ETC.

CONTINENTAL UNITED STATES

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

DIARRHEA AND DYSENTERY:

Morbidity from diarrhea and dysentery decreased by about 15 percent in August. During 1943 the admission rate from this cause increased steadily and rapidly during the early part of the year to reach a relatively high peak in July and then declined sharply. During 1944, however, the trend was only slightly upward, and the peak rate reached in July was less than half that for 1943. Current morbidity from diarrhea and dysentery is 45 percent lower than for August 1943. The Fourth and Fifth Service Commands (with rates of about 14 per thousand) reported the highest morbidity from this cause both in July and August.

VENEREAL DISEASE:

Morbidity from venereal diseases, excluding cases contracted prior to entry on active service, increased slightly in August to 35.8 per thousand, which is the highest admission rate from these causes since March 1942. Despite this relatively unfavorable experience for all forms of venereal disease, morbidity from syphilis has been decreasing rather steadily during the past two years; the syphilis admission rate of 4.0 per thousand for August 1944 was about 20 percent lower than for August 1943. Markedly higher morbidity from venereal diseases, excluding EPTS cases, was reported in August by the First and Sixth Service Commands and the Military District of Washington. The highest morbidity from these causes was reported by the Fifth Service Command, which had a rate 50 percent higher than for the country as a whole. Relatively high admission rates (about 30 percent higher than for the country as a whole) were reported for the First, Second, and Sixth Service Commands. The First and Second Service Commands were in this category largely because of high incidence among task force troops not under their jurisdiction.

Morbidity represented by venereal EPTS cases was reported at 10 per thousand during August as against 12 per thousand for July. The admission rate from this cause has been decreasing steadily during recent months as a result of the downward trend of the number of men inducted into the Army. Variations in the admission rate for venereal EPTS cases as between Service Commands have relatively little significance, because they reflect a different geographical and racial distribution of Army personnel as compared with that of new inductees.

The venereal disease cases remaining under treatment on 25 August 1944 are shown below.

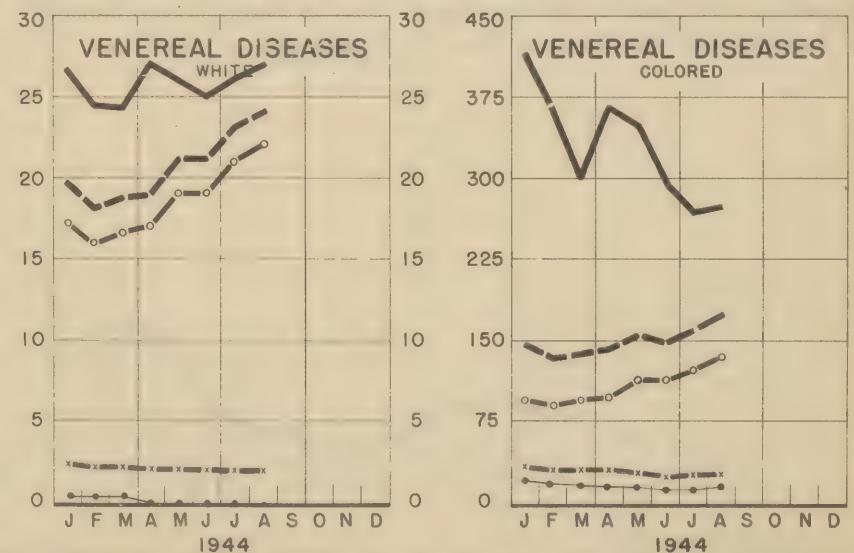

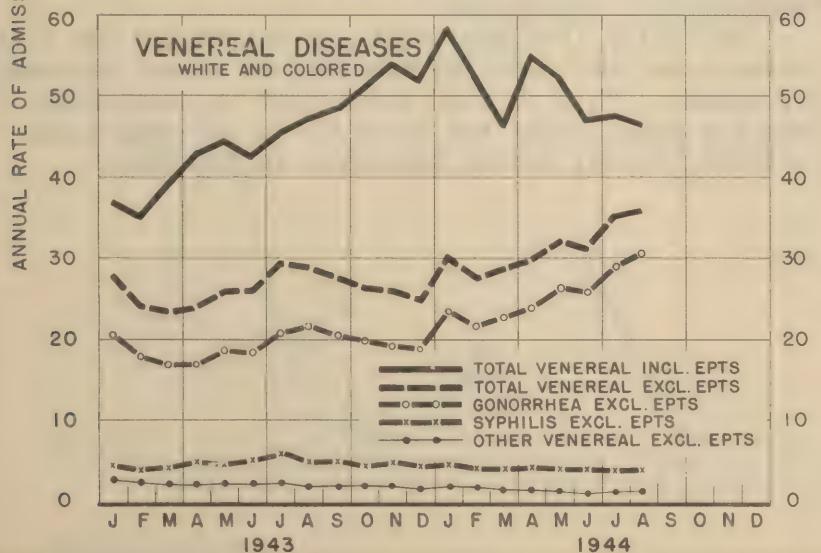

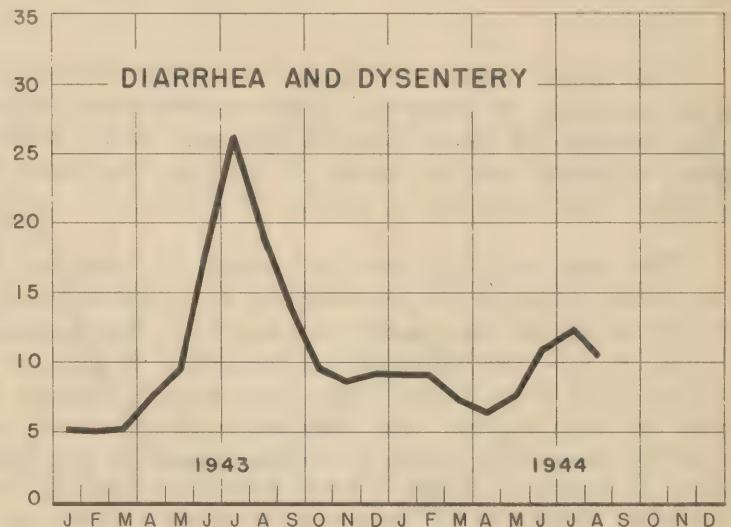

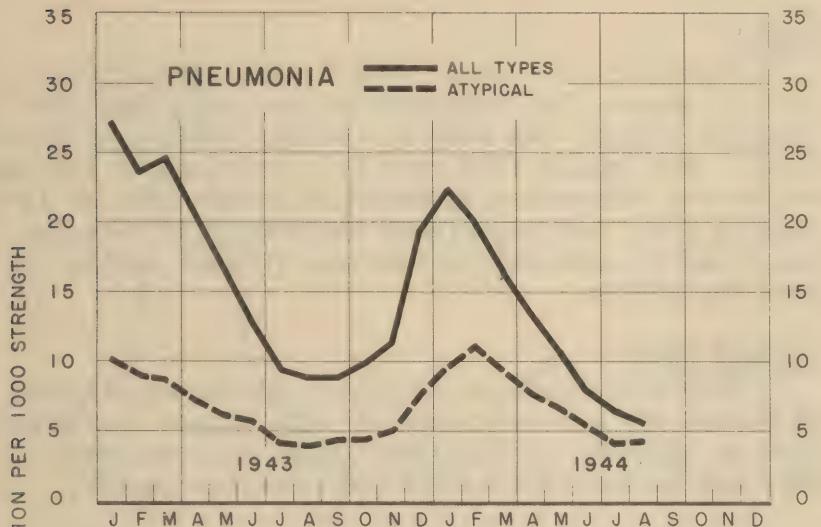

Service Command	Number Remaining under Treatment		Venereal Disease Cases as Percent of all Cases	
	Syphilis	Other	Syphilis	Other
TOTAL U.S.	1463	1943	.98	1.31
I	34	33	.8	.7
II	55	130	.5	1.2
III	170	189	1.7	1.9
MDW	37	50	.9	1.3
IV	347	365	1.0	1.1
V	111	169	1.0	1.5
VI	42	146	.6	2.0
VII	76	152	.6	1.2
VIII	357	438	1.2	1.5
IX	234	271	1.0	1.1

The great bulk of the cases remaining were contracted after entry on active service. The number of syphilis cases remaining at the end of August was 8 percent lower than for July, while for other venereal cases the corresponding decrease was 11 percent. Total venereal cases represented 2.29 percent of the total number of patients remaining under treatment in hospital. The very much longer duration of hospitalization

VENEREAL DISEASES

CONTINENTAL UNITED STATES

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

for syphilis is indicated by the fact that only 11 percent of the total venereal admissions (excluding EPTS cases) were for this cause, even though more than 40 percent of the cases remaining under treatment were for syphilis.

The total number of days lost from duty during August because of venereal disease was about 93,000 or an average of more than 23,000 per week; this represented a non-effective rate of .85 per thousand which was about the same as in June and July.

The very much higher incidence of venereal disease among colored as contrasted with white personnel is indicated in the chart on page 37. For colored troops in 1944 morbidity from venereal diseases, excluding EPTS cases, has been consistently about 7 times as high as for the remainder of the Army, while for EPTS cases the colored admission rate has been about 30 times as high. More detailed data as to the July incidence of venereal diseases by color are presented in the Supplementary Health Report contained in Weekly Health Report No. 34 (page 38).

MEASLES:

Morbidity from measles decreased seasonally to .2 per thousand, which is the lowest level recorded during the current war.

MUMPS:

Morbidity from mumps decreased by about 40 percent in August, but nevertheless was more than five times as high as the rate for either measles or scarlet fever. The August 1944 rate is approximately the same as for the corresponding month of either 1942 or 1943; judging from that experience the admission rate for mumps may be expected to decrease further during the next two months.

SCARLET FEVER:

Morbidity from scarlet fever decreased slightly in August and was at a rate of only .3 per thousand. This is believed to be close to the minimum level that may be anticipated for the next few months.

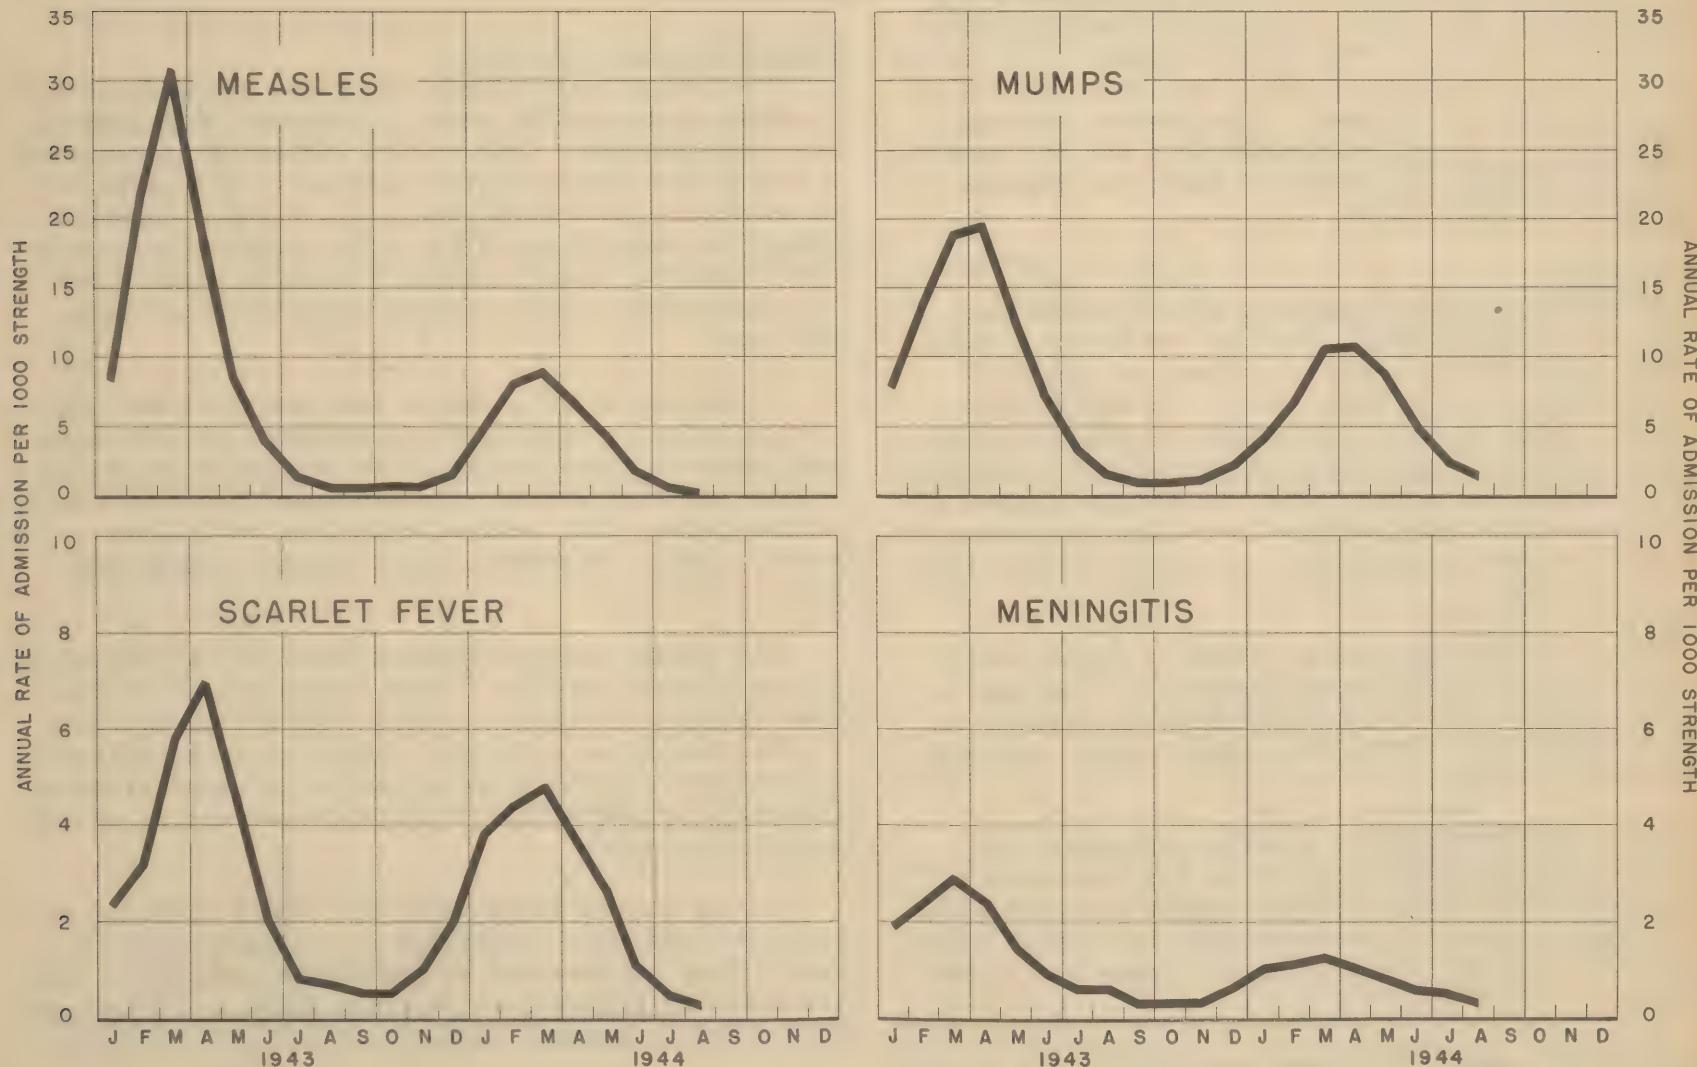

MENINGOCOCCIC MENINGITIS:

Morbidity from meningitis decreased for the fifth consecutive month and was reported at .3 per thousand for August. This is only about half the admission rate for August 1943 but close to the minimum level recorded in 1943 during September to November.

MORBIDITY FROM — MEASLES — MUMPS

SCARLET FEVER — MENINGITIS

CONTINENTAL UNITED STATES

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

RHEUMATIC FEVER:

Morbidity from rheumatic fever decreased by about 20 percent during August and was more than 50 percent under the peak rate reported during the period from March to May of this year. Morbidity from this cause is currently somewhat lower than in August 1943 but is slightly above the minimum rates for 1943 experienced during September to December. The Seventh Service Command with a rate almost triple that for the remainder of the country continued to report the highest morbidity from this cause.

TUBERCULOSIS:

Morbidity from tuberculosis was at a somewhat higher level during August than in the previous months of 1944; the number of cases reported was about 20 percent higher than in July. As of 25 August 1944 there were 1265 cases of tuberculosis remaining under treatment; these represented .85 percent of the total number of patients in hospital. Of the 1265 cases of tuberculosis remaining, 683 (or more than 50 percent) were at Fitzsimons G. H.

MALARIA:

Morbidity from malaria acquired in the United States was reported at .2 per thousand or the same as for the previous month. During 1944 the seasonal increase in morbidity during the summer months was much smaller than during 1943.

The number of cases of malaria presumably acquired overseas which were admitted for treatment in hospitals in this country during August averaged about 710 per week or about 5 percent above the weekly average for July and by far the highest figure so far recorded.

As of 25 August 1944 there were 3117 cases of malaria remaining under treatment, representing 2.10

percent of the total patients remaining under treatment in hospital. Only about 50 of these 3117 cases of malaria were those where the disease was acquired in the United States.

NEUROPSYCHIATRIC DISORDERS:

The annual rate of admission for neuropsychiatric disorders increased by about 15 percent in August to 36.3 per thousand. This is the highest rate reported in the United States during this war. Increases in the admission rate occurred in all Service Commands except the Seventh and Ninth. The current admission rate from this cause is about 5 percent higher than for August 1943, which was the second highest rate that year.

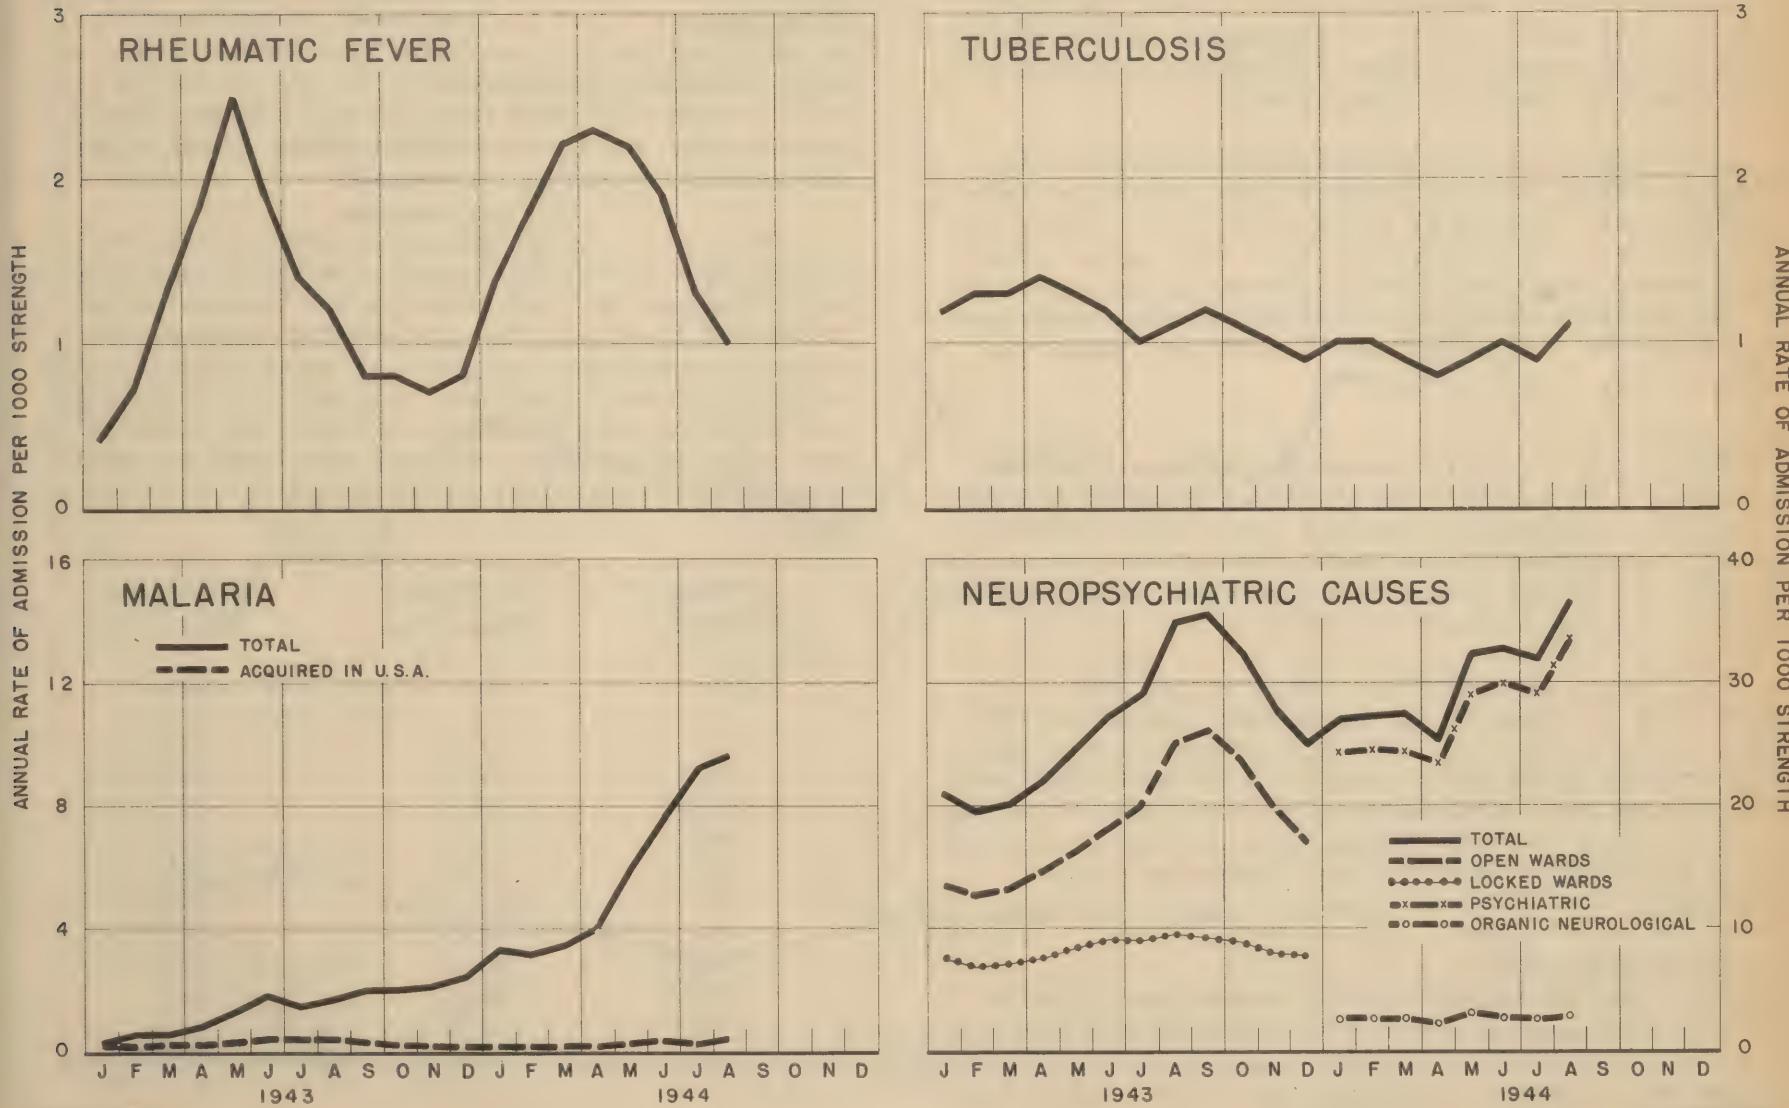

Attention is directed to the fact that the admission rates for the first four months of 1944 have been revised upward to allow for incorrect reporting by some stations (which reported some direct admissions as transfers). The revised rates are as follows: January - 28.3, February - 31.1, March - 30.8, and April - 28.8.

The Second Service Command continued to report by far the highest morbidity from neuropsychiatric disorders (73 per thousand or more than double the rate for the country as a whole); this high rate reflects in part the relatively large numbers of admissions at Atlantic City AAF Redistribution Center and at several General Hospitals.

During August there were 5613 CDD's given to enlisted men who were classified as neuropsychiatric cases. They represented 41 percent of all CDD's; the corresponding proportions for May, June, and July were 44, 43, and 43 percent respectively.

MORBIDITY FROM — RHEUMATIC FEVER — TUBERCULOSIS MALARIA — NEUROPSYCHIATRIC CAUSES

CONTINENTAL UNITED STATES

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

Psychiatric cases accounted for 92 percent of the total neuropsychiatric admissions. This proportion prevailed in most Service Commands except the Sixth and the Military District of Washington, where organic neurological cases accounted for about 15 percent and 25 percent of the total respectively.

The number of neuropsychiatric cases remaining under treatment as of 25 August 1944 was 16,157 or about 350 more than as of the end of July. All of the increase was accounted for by open ward cases. Neuropsychiatric cases remaining represented 10.9 percent of all patients remaining in hospital; open ward cases accounted for 7.6 percent and locked ward cases for 3.3 percent.

MORTALITY:

Mortality from all causes during August was reported at 2.72 per year per thousand or about the same as the rate for July, which was the highest recorded for any month during this war. The mortality rate from disease at .53 per thousand was markedly lower than the rate of .63 per thousand for July.

It should be noted that reporting of deaths on Forms 86ab is known to be incomplete, especially for deaths from injury for which the understatement may have been as great as 15 percent. The mortality rate from injury when adjusted to allow for under-reporting would be about 2.5 per thousand, resulting in an estimated total death rate from all causes of 3.0 per thousand.

NON-EFFECTIVE RATE:

The non-effective rate for August was reported at 38.3 per thousand strength or about 5 percent higher than in July; most of this increase arose because of an increase in hospital population at General Hospitals.

Despite lower admission rates the non-effective rate for August 1944 was 7 percent higher than for August 1943; this increase is more apparent than real since it is the result of the inclusion of days lost in General Hospitals by evacuees from overseas, who account for about 25 percent of the non-effective rate. The non-effective rate from injury in August was 7.9 per thousand, which is somewhat higher than in previous months.

Variations in the non-effective rate by Service Command do not reflect so much the variations in morbidity between Service Commands as the varying number of General Hospitals in each Service Command. When comparisons are made between the non-effective rates excluding General Hospitals, the variations in the non-effective rate by Service Command are seen to be very much smaller than when the days lost in General Hospitals are included, as evidenced in the table below:

<u>Service Command</u>	<u>Including Gen. Hosp.</u>	<u>Excluding Gen. Hosp.</u>
